BuySell Bazaar

A classifieds marketplace built so buyers and sellers stop wasting each other's time.

01 — WHAT IS IT

A mobile app for buying and selling locally

BuySell Bazaar is a mobile app — built with React Native, so the same codebase runs on both Android and iOS — for a local classifieds marketplace: the digital version of a community noticeboard, but structured, searchable, and safer to use than a Facebook group or a generic listings site.

It is designed around one idea that most classifieds apps miss: buying and selling are both search problems, but only one side usually gets tools for it. A seller lists an item and waits. A buyer searches and waits. BuySell Bazaar gives both sides a way to actively find each other.

The two-sided model

Every listing in the app is one of two types:

- **Ad** — "I am selling this." A seller posts an item with photos, price, and category.
- **Demand** — "I am looking for this." A buyer posts what they want to buy, even if nobody is selling it yet.

This means a buyer is never stuck passively scrolling and hoping — they can post a Demand and let sellers come to them. A seller, in turn, can browse open Demands and pitch directly to someone already looking to buy. Both directions of the transaction get the same first-class treatment.

02 — THE PROBLEM

Why local marketplaces waste people's time

Open-group and generic-listing marketplaces (Facebook Marketplace, OLX-style sites, WhatsApp groups) share the same weaknesses, and they all come down to trust:

- Photos are copied from Google Images or another listing — the item in hand doesn't match what was posted.
- Sellers pad their profile with fake or bought reviews, so a 5-star rating stops meaning anything.
- Buyers travel to see an item, or chase a seller for days, only to find out the listing was never real.

Every one of these wastes real time and real trust — and once a buyer gets burned once, they stop trusting the platform itself, not just the one bad seller.

03 — THE SOLUTION

How BuySell Bazaar earns that trust back

The app's anti-scam design isn't a policy or a warning banner — it's built into how posting actually works.

Live photo capture, not gallery upload

When a seller posts an Ad, the app opens the camera directly and will not accept a gallery upload — the photo has to be taken of the item, right then, in the app. There is no way to upload a stock photo, a picture pulled off Google, or someone else's photo from another listing. A buyer looking at an Ad photo knows it was taken of that exact item.

(Demand posts allow gallery photos, since a buyer describing what they're looking for isn't showing a physical item they possess — the restriction applies specifically where it matters.)

Rating-based filtering

Buyers can filter every listing by the seller's rating range, so a search for "laptops near me" can be narrowed to sellers who have actually built up trust, instead of scrolling past every account regardless of history.

Verified, permission-gated location

Ads are tied to a verified location before they go live — framed to the user plainly as fraud prevention, not a generic permission popup — which keeps listings tied to a real place instead of a shell account posting from nowhere.

Direct, in-app conversation

Every listing opens straight into a real-time chat with its owner. No phone-number sharing on a public post, no getting redirected off-platform to "confirm" a deal outside the app where there's no record of what was agreed.

04 — WHO BENEFITS, AND HOW

What this actually saves people

Every feature above points at the same outcome: fewer wasted trips, fewer wasted conversations, fewer people burned by a listing that was never real.

For buyers

What you see is closer to what you get — the photo was taken of the actual item, sellers can be filtered by trust, and you can post a Demand instead of endlessly searching for something no one has listed yet.

For sellers

A real rating and a verified location make a listing worth more than an anonymous post in a group — and Demands surface buyers who are already looking for exactly what you have.

For both sides

Conversation happens in one place, tied to the listing, instead of scattered across phone calls and off-app messages with no record.

For the platform

Fewer fake listings and fewer bad experiences mean people keep coming back — trust is the product, not a feature bolted onto it.

Tech stack

Built as a single React Native codebase targeting both Android and iOS, backed by Firebase for the real-time and account pieces, and a REST API for everything else.

Layer	Technologies
Core	React Native 0.79 · React 19 · TypeScript · Metro bundler
Navigation	React Navigation v7 (native stack + bottom tabs) · Reanimated · Gesture Handler
Data & state	TanStack Query (server state/caching) · Axios · Zustand (auth state) · AsyncStorage
Firebase	Authentication · Firestore (chat) · Cloud Messaging (push notifications) · Crashlytics · Analytics · Storage
Device features	Camera capture & gallery picker · Maps & geolocation · Local notifications (Notifee)
Native tooling	Android — Gradle · iOS — CocoaPods / Xcode · ESLint + Prettier · Jest

06 — FEATURE SUMMARY

What's built today

Area	What it does
Onboarding & auth	Splash → guided intro → signup with OTP verification, login, password reset
Browse	Category rails, featured ads, search, and multi-filter results (including the rating filter)
Post	Separate flows for Ads (camera-only photos) and Demands (gallery allowed)
Listings	Full detail views for both Ads and Demands, plus "my ads" / "my posts" management
Chat	Real-time, per-listing conversation with an inbox and unread-count tracking
Notifications	Push (Firebase Cloud Messaging) and local (Notifee) notifications
Account	Profile, favorites, permissions management, account settings
Monetization hook	A "feature my ad" banner routes sellers to a WhatsApp contact for paid placement

A closing note

The camera-only rule, the rating filter, and the verified location together already remove the three most common ways people get scammed on a local marketplace: fake photos, fake reputations, and fake sellers.
